(54) Title: ARYLOXY AND ARYLALKYLENEOXY SUBSTITUTED IMIDAZOQUINOLINES

(57) Abstract: Imidazoquinoline compounds with an aryloxy or arylalkyleneoxy or hydroxy substituent at the 6, 7, 8, or 9-position, pharmaceutical compositions containing the compounds, intermediates, and methods of use of these compounds as immunomodulators, for modulating cytokine biosynthesis in animals and in the treatment of diseases including viral and neoplastic diseases, are disclosed.

WO 2005/020999 A1

ARYLOXY AND ARYLALKYLENEOXY SUBSTITUTED  
IMIDAZOQUINOLINES

RELATED APPLICATIONS

The present invention claims priority to U.S. Provisional Application Serial No. 60/498270, filed August 27, 2003, and U.S. Provisional Application Serial No. 60/581254, filed June 18, 2004, both of which are incorporated herein by reference.

BACKGROUND

There has been a major effort in recent years to find compounds that modulate the immune system. Examples of such compounds, which have demonstrated cytokine inducing and immunomodulating activity that render them useful in the treatment of a variety of disorders, include certain 1*H*-imidazo[4,5-*c*]quinolin-4-amine, 1*H*-imidazo[4,5-*c*]pyridin-4-amine, tetrahydroquinolin-4-amine, naphthyridin-4-amine, and tetrahydronaphthyridin-4-amine compounds as well as certain analogous thiazolo and oxazolo compounds.

But despite important progress in the effort to find immunomodulating compounds, there is still a critical scientific and medical need for additional compounds that have an ability to modulate aspects of the immune response, by induction or inhibition of cytokine biosynthesis or other mechanisms.

SUMMARY

A new class of compounds useful for modulating cytokine biosynthesis has now been found. In one aspect, the present invention provides such compounds, which are of the following Formula I:

I

wherein R, n, R', R'' and R<sub>3</sub> are as defined below; and pharmaceutically acceptable salts thereof.

5           The compounds and/or salts of Formula I are useful as immune response modifiers (IRMs) due to their ability to modulate cytokine biosynthesis (e.g., induce or inhibit the biosynthesis or production of one or more cytokines) and otherwise modulate the immune response when administered to animals. This makes the compounds or salts useful in the treatment of a variety of conditions such as viral diseases and neoplastic diseases that are responsive to such changes in the immune response.

10           In another aspect, the present invention provides pharmaceutical compositions containing an effective amount of a compound or salt of the invention, and methods of modulating (e.g., inducing or inhibiting) cytokine biosynthesis in an animal, treating a viral disease in an animal, and treating a neoplastic disease in an animal, by administering an effective amount of one or more compounds of Formula I and/or pharmaceutically acceptable salts thereof to the animal.

15           In another aspect, the present invention provides methods of synthesizing compounds of Formula I and intermediate compounds useful in the synthesis of these compounds. Certain of these intermediate compounds, for example, compounds of the Formula VII described below, have also been found to be useful as immune response modifiers as described above. Accordingly, the present invention provides pharmaceutical compositions containing an effective amount of one or more of these compounds and/or salts thereof, and methods of inducing cytokine biosynthesis in an animal, treating a viral disease in an animal, and treating a neoplastic disease in an animal, by administering an effective amount of one or more of these compounds and/or pharmaceutically acceptable salts thereof to the animal.

25           As used herein, "a," "an," "the," "at least one," and "one or more" are used interchangeably.

The terms "comprising" and variations thereof do not have a limiting meaning where these terms appear in the description and claims.

The above summary of the present invention is not intended to describe each disclosed embodiment or every implementation of the present invention. The description  
 5 that follows more particularly exemplifies illustrative embodiments. Guidance is also provided herein through lists of examples, which can be used in various combinations. In each instance, the recited list serves only as a representative group and should not be interpreted as an exclusive list.

As used herein, the terms "alkyl," "alkenyl," "alkynyl" and the prefix "alk-" are inclusive of both straight chain and branched chain groups and of cyclic groups, i.e. cycloalkyl and cycloalkenyl. Unless otherwise specified, these groups contain from 1 to  
15 20 carbon atoms, with alkenyl groups containing from 2 to 20 carbon atoms, and alkynyl groups containing from 2 to 20 carbon atoms. In some embodiments, these groups have a total of up to 10 carbon atoms, up to 8 carbon atoms, up to 6 carbon atoms, or up to 4 carbon atoms. Cyclic groups can be monocyclic or polycyclic and preferably have from 3  
20 to 10 ring carbon atoms. Exemplary cyclic groups include cyclopropyl, cyclopropylmethyl, cyclopentyl, cyclohexyl, adamantyl, and substituted and unsubstituted bornyl, norbornyl, and norbornenyl.

Unless otherwise specified, "alkylene," "-alkylene-", "alkenylene", "-alkenylene-", "alkynylene", and "-alkynylene-" are the divalent forms of the "alkyl",  
25 "alkenyl", and "alkynyl" groups defined above. The terms "alkylenyl", "alkenylenyl", and "alkynylenyl" are used when "alkylene", "alkenylene", and "alkynylene", respectively, are substituted. For example, an arylalkylenyl group comprises an "alkylene" moiety to which an aryl group is attached.

The term "haloalkyl" is inclusive of alkyl groups that are substituted by one or  
30 more halogen atoms, including perfluorinated groups. This is also true of other groups that

include the prefix "halo-". Examples of suitable haloalkyl groups are chloromethyl, trifluoromethyl, and the like.

The term "aryl" as used herein includes carbocyclic aromatic rings or ring systems. Examples of aryl groups include phenyl, naphthyl, biphenyl, fluorenyl and indenyl.

5 The term "heteroatom" refers to the atoms O, S, or N.

The term "heteroaryl" includes aromatic rings or ring systems that contain at least one ring heteroatom (e.g., O, S, N). Suitable heteroaryl groups include furyl, thienyl, pyridyl, quinolinyl, isoquinolinyl, indolyl, isoindolyl, triazolyl, pyrrolyl, tetrazolyl, imidazolyl, pyrazolyl, oxazolyl, thiazolyl, benzofuranyl, benzothiophenyl, carbazolyl, benzoxazolyl, pyrimidinyl, benzimidazolyl, quinoxalinyl, benzothiazolyl, naphthyridinyl, isoxazolyl, isothiazolyl, purinyl, quinazolinyl, pyrazinyl, 1-oxidopyridyl, pyridazinyl, triazinyl, tetrazinyl, oxadiazolyl, thiadiazolyl, and so on.

10

The term "heterocyclyl" includes non-aromatic rings or ring systems that contain at least one ring heteroatom (e.g., O, S, N) and includes all of the fully saturated and partially unsaturated derivatives of the above mentioned heteroaryl groups. Exemplary heterocyclic groups include pyrrolidinyl, tetrahydrofuranyl, morpholinyl, thiomorpholinyl, piperidinyl, piperazinyl, thiazolidinyl, imidazolidinyl, isothiazolidinyl, tetrahydropyranyl, quinuclidinyl, homopiperidinyl, homopiperazinyl, and the like.

15

The terms "arylene", "heteroarylene", and "heterocyclylene" are the divalent forms of the "aryl", "heteroaryl", and "heterocyclyl" groups defined above. The terms "arylenyl", "heteroarylenyl," and "heterocyclenyl" are used when "arylene", "heteroarylene", and "heterocyclylene", respectively, are substituted. For example, an alkylarylenyl group comprises an arylene moiety to which an alkyl group is attached.

20

When a group (or substituent or variable) is present more than once in any Formula described herein, each group (or substituent or variable) is independently selected, whether explicitly stated or not. For example, for the formula  $-N(R_8)-C(R_6)-N(R_8)-$  each  $R_8$  group is independently selected. In another example, when an  $R_2$  and an  $R_3$  group both contain an  $R_4$  group, each  $R_4$  group is independently selected. In a further example, when more than one Y group is present (i.e.,  $R_2$  and  $R_3$  both contain a Y group) and each Y group contains one or more  $R_8$  groups, then each Y group is independently selected, and each  $R_8$  group is independently selected.

### Preparation of Compounds

Compounds of the invention can be prepared according to Reaction Scheme I where R, R<sub>1</sub>, R<sub>2</sub>, and n are as defined above. In step (1) of Reaction Scheme I, a benzyloxyaniline of Formula XV is treated with the condensation product generated from 2,2-dimethyl-1,3-dioxane-4,6-dione (Meldrum's acid) and triethyl orthoformate to provide an imine of Formula XVI. The reaction is conveniently carried out by adding a solution of a benzyloxyaniline of Formula XV to a heated mixture of Meldrum's acid and triethyl orthoformate and heating the reaction at an elevated temperature such as 45 °C. The product can be isolated using conventional methods.

In step (2) of Reaction Scheme I, an imine of Formula XVI undergoes thermolysis and cyclization to provide a benzyloxyquinolin-4-ol of Formula XVII. The reaction is conveniently carried out in a medium such as DOWTHERM A heat transfer fluid at a temperature between 200 and 250 °C. The product can be isolated using conventional methods.

In step (3) of Reaction Scheme I, the benzyloxyquinolin-4-ol of Formula XVII is nitrated under conventional nitration conditions to provide a benzyloxy-3-nitroquinolin-4-ol of Formula XVIII. The reaction is conveniently carried out by adding nitric acid to the benzyloxyquinolin-4-ol of Formula XVII in a suitable solvent such as propionic acid and heating the mixture at an elevated temperature such as 125 °C. The product can be isolated using conventional methods.

In step (4) of Reaction Scheme I, a benzyloxy-3-nitroquinolin-4-ol of Formula XVIII is chlorinated using conventional chlorination chemistry to provide a benzyloxy-4-chloro-3-nitroquinoline of Formula XIX. The reaction is conveniently carried out by treating the benzyloxy-3-nitroquinolin-4-ol of Formula XVIII with phosphorous oxychloride in a suitable solvent such as *N,N*-dimethylformamide (DMF). The reaction can be carried out at an elevated temperature such as 100 °C, and the product can be isolated using conventional methods.

In step (5) of Reaction Scheme I, a benzyloxy-4-chloro-3-nitroquinoline of Formula XIX is treated with an amine of Formula R<sub>1</sub>-NH<sub>2</sub> to provide a benzyloxy-3-nitroquinolin-4-amine of Formula XX. Several amines of Formula R<sub>1</sub>-NH<sub>2</sub> are

commercially available; others can be prepared by known synthetic methods. The reaction is conveniently carried out by adding the amine of Formula  $R_1-NH_2$  to a solution of the benzyloxy-4-chloro-3-nitroquinoline of Formula XIX in a suitable solvent such as dichloromethane or methanol in the presence of a tertiary amine such as triethylamine.

5 The reaction can be carried out at ambient temperature or at an elevated temperature such as, for example, the reflux temperature of the solvent. The reaction product can be isolated using conventional methods.

In step (6) of Reaction Scheme I, a benzyloxy-3-nitroquinolin-4-amine of Formula XX is reduced to provide a benzyloxyquinoline-3,4-diamine of Formula XXI. The  
10 reaction can be carried out by hydrogenation using a heterogeneous hydrogenation catalyst such as platinum on carbon. The hydrogenation is conveniently carried out in a Parr apparatus in a suitable solvent such as toluene, methanol, or acetonitrile. The reaction can be carried out at ambient temperature or at an elevated temperature such as 55 °C, and the product can be isolated using conventional methods.

15 Alternatively, the reduction in step (6) can be carried out using nickel boride, prepared *in situ* from sodium borohydride and nickel(II) chloride. The reduction is conveniently carried out by adding a solution of a benzyloxy-3-nitroquinolin-4-amine of Formula XX in a suitable solvent or solvent mixture such as dichloromethane/methanol to a mixture of excess sodium borohydride and catalytic nickel(II) chloride in methanol. The  
20 reaction can be carried out at ambient temperature. The product can be isolated using conventional methods.

In step (7) of Reaction Scheme I, a benzyloxyquinoline-3,4-diamine of Formula XXI is treated with a carboxylic acid equivalent to provide a benzyloxy-1*H*-imidazo[4,5-*c*]quinoline of Formula XXII. Suitable carboxylic acid equivalents include orthoesters of  
25 Formula  $R_2C(O-alkyl)_3$ , 1,1-dialkoxyalkyl alkanoates of Formula  $R_2C(O-alkyl)_2(O-C(O)-alkyl)$ , and acid chlorides of Formula  $R_2C(O)Cl$ . The selection of the carboxylic acid equivalent is determined by the desired substituent at  $R_2$ . For example, triethyl orthoformate will provide a compound where  $R_2$  is hydrogen, and trimethyl orthovalerate will provide a compound where  $R_2$  is a butyl group. The reaction is  
30 conveniently carried out by adding the carboxylic acid equivalent to a benzyloxyquinoline-3,4-diamine of Formula XXI in a suitable solvent such as toluene or xylenes. Optionally,

catalytic pyridine hydrochloride can be added. The reaction is carried out at a temperature high enough to drive off alcohol or water formed during the reaction. Conveniently, a Dean-Stark trap can be used to collect the volatiles.

Alternatively, step (7) can be carried out in two steps when an acid chloride of Formula  $R_2C(O)Cl$  is used as the carboxylic acid equivalent. Part (i) of step (7) is conveniently carried out by adding the acid chloride to a solution of a benzyloxyquinoline-3,4-diamine of Formula XXI in a suitable solvent such as dichloromethane or acetonitrile to afford an amide. Optionally, a tertiary amine such as triethylamine, pyridine, or 4-dimethylaminopyridine can be added. The reaction can be carried out at ambient temperature or at an elevated temperature. The amide product can be isolated and optionally purified using conventional techniques. Part (ii) of step (7) involves heating the amide prepared in part (i) to provide a benzyloxy-1*H*-imidazo[4,5-*c*]quinoline of Formula XXII. The reaction is conveniently carried out in a suitable solvent such as toluene at a temperature sufficient to drive off water formed during the reaction. In part (ii) of step (7), the imidazo ring forming reaction can also be carried out in a solvent such as ethanol or methanol in the presence of a base such as triethylamine or aqueous sodium hydroxide. The benzyloxy-1*H*-imidazo[4,5-*c*]quinoline of Formula XXII can be isolated using conventional methods.

In one embodiment, the present invention provides a process comprising the steps of (1) providing a 3-amido-4-aminoquinoline substituted at the 5-, 6-, 7-, or 8-position with one benzyloxy group and optionally with one R group, wherein amido is  $-NH-C(O)-R_2$ , amino is  $-NH-R_1$ , and R,  $R_1$ , and  $R_2$  are as defined above; (2) preparing a mixture comprising an alcohol and the compound provided in step (1); and (3) contacting the mixture of step (2) with a base to provide a 1-*H*-imidazo[4,5-*c*]quinoline substituted at the 1-position with  $R_1$ , at the 2-position with  $R_2$ ; and at the 5-, 6-, 7-, or 8-position with one benzyloxy group and optionally with one R group; wherein the base is aqueous sodium hydroxide or triethylamine. In certain embodiments, the alcohol is methanol, ethanol, or a mixture thereof. In certain embodiments, the base is aqueous sodium hydroxide.

In step (8) of Reaction Scheme I, a benzyloxy-1*H*-imidazo[4,5-*c*]quinoline of Formula XXII is oxidized to provide a benzyloxy-1*H*-imidazo[4,5-*c*]quinoline-5*N*-oxide of Formula XXIII using a conventional oxidizing agent capable of forming *N*-oxides. The

reaction is conveniently carried out by adding 3-chloroperoxybenzoic acid to a solution of a compound of Formula XXII in a solvent such as dichloromethane or chloroform. The reaction can be carried out at ambient temperature, and the product can be isolated using conventional methods.

5 In step (9) of Reaction Scheme I, a benzyloxy-1*H*-imidazo[4,5-*c*]quinoline-5*N*-oxide of Formula XXIII is aminated to provide a benzyloxy-1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XXIV, a subgenus of Formulas I, II, and III. Step (9) can be carried out by the activation of an *N*-oxide of Formula XXIII by conversion to an ester and then reacting the ester with an aminating agent. Suitable activating agents include alkyl- or  
10 arylsulfonyl chlorides such as benzenesulfonyl chloride, methanesulfonyl chloride, or *p*-toluenesulfonyl chloride. Suitable aminating agents include ammonia, in the form of ammonium hydroxide, for example, and ammonium salts such as ammonium carbonate, ammonium bicarbonate, and ammonium phosphate. The reaction is conveniently carried out by adding ammonium hydroxide to a solution of the *N*-oxide of Formula XXIII in a  
15 suitable solvent such as dichloromethane or chloroform and then adding *p*-toluenesulfonyl chloride. The reaction can be carried out at ambient temperature. The reaction may be carried out by adding ammonium hydroxide and *p*-toluenesulfonyl chloride to the reaction mixture from step (8) without isolating the *N*-oxide of Formula XXIII. The product or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

20 Alternatively step (9) can be carried out by the reaction of a benzyloxy-1*H*-imidazo[4,5-*c*]quinoline-5*N*-oxide of Formula XXIII with trichloroacetyl isocyanate followed by hydrolysis of the resulting intermediate to provide a benzyloxy-1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XXIV. The reaction is conveniently carried out in two steps by (i) adding trichloroacetyl isocyanate to a solution of the *N*-oxide of  
25 Formula XXIII in a solvent such as dichloromethane and stirring at ambient temperature to provide an isolable amide intermediate. In step (ii), a solution of the intermediate in methanol is treated with a base such as sodium methoxide or ammonium hydroxide at ambient temperature. The product or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

Reaction Scheme I

5 For some embodiments, compounds shown in Reaction Scheme I can be further elaborated using conventional synthetic methods. For example, an amine of Formula R<sub>1</sub>-NH<sub>2</sub>, where R<sub>1</sub> is R<sub>4</sub>, may be substituted by a hydroxy or second amino group, which can be further functionalized before step (6) of Reaction Scheme I. For example, a benzyloxy-3-nitroquinolin-4-amine of Formula XX, in which R<sub>1</sub> is R<sub>4</sub> having a hydroxy substituent, can be chlorinated using conventional chlorinating agents and subsequently reacted with a thioalkoxide salt to provide a benzyloxy-3-nitroquinolin-4-amine of Formula XX in which R<sub>1</sub> is -X-Y-R<sub>4</sub>, where X and R<sub>4</sub> are defined as above and Y is -S-. The chlorination reaction is conveniently carried out by adding thionyl chloride to a solution of a

10 benzyloxy-3-nitroquinolin-4-amine of Formula XX, in which R<sub>1</sub> is R<sub>4</sub> having a hydroxy

substituent, in a solvent such as dichloromethane and heating the reaction at an elevated temperature. The thioether group is conveniently introduced by adding thioalkoxide salt, such as sodium thiomethoxide, to a solution of a benzyloxy-3-nitroquinolin-4-amine of Formula XX, in which  $R_1$  is  $R_4$  having a chloro substituent, in a solvent such as DMF.

5 The reaction may be carried out at ambient temperature or at an elevated temperature. The thioether group thus introduced may be oxidized to a sulfone group with excess oxidizing agent in step (8) of Reaction Scheme I to provide a benzyloxy-1*H*-imidazo[4,5-*c*]quinoline-5*N*-oxide of Formula XXIII in which  $R_1$  is  $-X-Y-R_4$ , where  $Y$  is  $-S(O)_2-$ .

10 A benzyloxy-3-nitroquinolin-4-amine of Formula XX, in which  $R_1$  is  $R_4$  having an amino substituent, may also be functionalized before step (6) of Reaction Scheme I using conventional methods. For example, a benzyloxy-3-nitroquinolin-4-amine of Formula XX, in which  $R_1$  is  $R_4$  having an amino substituent, can react with a sulfonyl chloride of Formula  $R_4-S(O)_2Cl$  or a sulfonic anhydride of Formula  $(R_4-S(O)_2)_2O$  to provide a compound of Formula XX in which  $R_1$  is  $-X-Y-R_4$ , where  $Y$  is  $-N(R_8)-S(O)_2-$ , wherein  $R_8$   
15 is defined as above. Numerous sulfonyl chlorides and sulfonic anhydrides are commercially available; others can be readily prepared using known synthetic methods. The reaction can be conveniently carried out by adding the sulfonyl anhydride to a solution of a benzyloxy-3-nitroquinolin-4-amine of Formula XX, in which  $R_1$  is  $R_4$  having an amino substituent, and a base such as triethylamine in a suitable solvent such as  
20 dichloromethane. The reaction can be carried out at ambient temperature. The product can then be treated according to steps (6)-(9) of Reaction Scheme I.

In some embodiments, further elaboration at  $R_1$  is introduced according to Reaction Scheme II where  $R$ ,  $R_2$ ,  $R_4$ ,  $R_5$ ,  $X$ ,  $Q$ , and  $n$  are defined as above. In step (1) of Reaction Scheme II, a benzyloxy-4-chloro-3-nitroquinoline of Formula XIX is treated with  
25 a Boc-protected diamine of Formula  $(CH_3)_3CO-C(O)-NH-X-NH_2$  to provide a benzyloxy-3-nitroquinolin-4-amine of Formula XXV. Several Boc-protected diamines of Formula  $(CH_3)_3CO-C(O)-NH-X-NH_2$  are commercially available; others can be prepared by known synthetic methods. The reaction is conveniently carried out by adding the Boc-protected diamine of Formula  $(CH_3)_3CO-C(O)-NH-X-NH_2$  to a cooled solution of the benzyloxy-4-  
30 chloro-3-nitroquinoline of Formula XIX in a suitable solvent such as dichloromethane or water in the presence of a tertiary amine such as triethylamine. The reaction can be carried

out at ambient temperature or at an elevated temperature such as, for example, the reflux temperature of the solvent. The product can be isolated using conventional methods.

In steps (2)-(5) of Reaction Scheme II, a benzyloxy-3-nitroquinolin-4-amine of Formula XXV is first reduced to provide a benzyloxyquinoline-3,4-diamine of Formula XXVI, which is converted to benzyloxy-1*H*-imidazo[4,5-*c*]quinoline of Formula XXVII by reaction with a carboxylic acid equivalent. The benzyloxy-1*H*-imidazo[4,5-*c*]quinoline of Formula XXVII is then oxidized to afford a benzyloxy-1*H*-imidazo[4,5-*c*]quinoline-5*N*-oxide of Formula XXVIII, which is aminated to provide a benzyloxy-1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XXIX, a subgenus of Formulas I, II, and III. Steps (2), (3), (4), and (5) of Reaction Scheme II can be carried out as described for steps (6), (7), (8), and (9), respectively, of Reaction Scheme I to provide a benzyloxy-1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XXIX as the product formed after step (5). In step (5), the preferred conditions for amination are the activation of an *N*-oxide of Formula XXVIII by conversion to an ester and then reacting the ester with an aminating agent. Step (5) is conveniently carried out by adding ammonium hydroxide to a solution of the *N*-oxide of Formula XXVIII in a suitable solvent such as dichloromethane or dichloroethane and then adding *p*-toluenesulfonyl chloride and stirring at ambient temperature. The product can be isolated using conventional methods.

In step (6) of Reaction Scheme II, the Boc-protecting group of a benzyloxy-1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XXIX is removed to provide a benzyloxy-1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XXX, which represents a subgenus of Formulas I, II, and III. The reaction is conveniently carried out by adding a solution of hydrochloric acid in ethanol to a benzyloxy-1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XXIX. The reaction can be carried out at an elevated temperature, for example, the reflux temperature of the solvent. The product or pharmaceutically acceptable salt thereof can be isolated by conventional methods.

In step (7) of Reaction Scheme II, a benzyloxy-1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XXX is converted to a benzyloxy-1*H*-imidazo[4,5-*c*]quinolin-1-yl compound of Formula XXXI using conventional methods. For example, a benzyloxy-1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XXX can react with an acid chloride of Formula R<sub>4</sub>C(O)Cl to provide a compound of Formula XXXI in which Q is -C(O)-. In

addition, a benzyloxy-1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XXX can react with sulfonyl chloride of Formula  $R_4S(O)_2Cl$  or a sulfonic anhydride of Formula  $(R_4S(O)_2)_2O$  to provide a compound of Formula XXXI in which Q is  $-S(O)_2-$ . Numerous acid chlorides of Formula  $R_4C(O)Cl$ , sulfonyl chlorides of Formula  $R_4S(O)_2Cl$ , and sulfonic anhydrides of Formula  $(R_4S(O)_2)_2O$  are commercially available; others can be readily prepared using known synthetic methods. The reaction can be conveniently carried out by adding the acid chloride of Formula  $R_1C(O)Cl$ , sulfonyl chloride of Formula  $R_1S(O)_2Cl$ , or sulfonic anhydride of Formula  $(R_4S(O)_2)_2O$  to a cooled solution of a benzyloxy-1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XXX and a base such as triethylamine in a suitable solvent such as chloroform, dichloromethane, or acetonitrile. The reaction can be carried out at ambient temperature or a sub-ambient temperature such as 0 °C. The product or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

Ureas of Formula XXXI, where Q is  $-C(R_6)-N(R_8)-W-$ , in which  $R_6$  is =O,  $R_8$  is defined as above, and W is a bond, can be prepared by reacting a benzyloxy-1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XXX with isocyanates of Formula  $R_4N=C=O$  or carbamoyl chlorides of Formula  $R_4N-(R_8)-C(O)Cl$ . Numerous isocyanates of Formula  $R_4N=C=O$  and carbamoyl chlorides of Formula  $R_4N-(R_8)-C(O)Cl$  are commercially available; others can be readily prepared using known synthetic methods. The reaction can be conveniently carried out by adding the isocyanate or carbamoyl chloride to a cooled solution of a benzyloxy-1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XXX and a base such as triethylamine in a suitable solvent such as dichloromethane or chloroform. The reaction can be carried out at ambient temperature or a sub-ambient temperature such as 0 °C. Alternatively, a compound of Formula XXX can be treated with an isocyanate of Formula  $R_4(CO)N=C=O$ , a thioisocyanate of Formula  $R_4N=C=S$ , or a sulfonyl isocyanate of Formula  $R_4S(O)_2N=C=O$  to provide a compound of Formula XXXI, where Q is  $-C(R_6)-N(R_8)-W-$ , in which  $R_6$ ,  $R_8$ , and W are defined as above. The product or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

A benzyloxy-1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XXX can also be converted to a benzyloxy-1*H*-imidazo[4,5-*c*]quinolin-1-yl compound of Formula XXXIa, wherein  $R_5$  is

R<sub>6</sub>, R<sub>7</sub>, R<sub>8</sub>, and A are as defined above, as shown in step (7a) of Reaction Scheme II.

A compound of Formula XXX can be treated with a carbamoyl chloride of

Formula under the conditions described in step (7) to provide a compound of Formula XXXIa, wherein R<sub>5</sub> is

where V is  $\text{---NH---C(O)---}$ , and A is as defined above. The product or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

In step (7a), a compound of Formula XXX can also react with a chloroalkanesulfonyl chloride of Formula  $\text{Cl---R}_7\text{S(O)}_2\text{Cl}$  or a chloroalkanoyl chloride of Formula  $\text{Cl---R}_7\text{C(O)Cl}$ , wherein R<sub>7</sub> is as defined above. The reaction is conveniently carried out by adding the chloroalkanesulfonyl chloride or chloroalkanoyl chloride to a solution of amine in a suitable solvent such as chloroform or dichloromethane in the presence of a base such as triethylamine at ambient temperature. The isolable intermediate chloroalkanesulfonamide or chloroalkanamide can then be treated with a base such as 1,8-diazabicyclo[5.4.0]undec-7-ene at ambient temperature in a suitable solvent such as DMF to effect the cyclization to afford a compound of Formula XXXIa in which R<sub>5</sub> is

The product or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

It may be desirable in some instances to carry out the steps of Reaction Scheme II in a different order. For example, a compound of Formula XXVII may be deprotected according to step (6), and the resulting amine may be functionalized as in step (7) or (7a) prior to the oxidation and amination steps (4) and (5), respectively.

## Reaction Scheme II

Synthetic transformations similar to those described in steps (7) and (7a) of Reaction Scheme II can also be made at  $R_2$  of a benzyloxy-1*H*-imidazo[4,5-*c*]quinoline of Formula XXIV if, for example, an acid chloride used in step (7) of Reaction Scheme I contains a protected hydroxy or amino group or a halogen. Several acid chlorides of this type, for example acetoxyacetyl chloride and chloroacetyl chloride, are commercially available; others such as 5-(*tert*-butoxycarbonylamino)valeryl chloride can be prepared using known synthetic methods. An  $R_2$  functional group introduced in this manner can

then be manipulated to reveal an amino group, which can be converted into a variety of functional groups according to the methods described in steps (7) and (7a) of Reaction Scheme II. For example, chloroacetyl chloride can be used in step (7) of Reaction Scheme I to introduce a chloromethyl-substituted benzyloxy-1*H*-imidazo[4,5-*c*]quinoline, which can be oxidized and aminated according to steps (8) and (9) of Reaction Scheme I. The resulting chloromethyl-substituted benzyloxy-1*H*-imidazo[4,5-*c*]quinolin-4-amine can be treated with ammonia in a suitable solvent such as methanol to provide an aminomethyl-substituted benzyloxy-1*H*-imidazo[4,5-*c*]quinolin-4-amine, which can then be treated according to the methods described in step (7) or (7a) of Reaction Scheme II to provide a variety of compounds.

Compounds of the invention can be prepared according to Reaction Scheme III where R, R<sub>1</sub>, R<sub>2</sub>, and n are defined as above and R<sub>3</sub> is -Z-Ar, -Z-Ar'-Y-R<sub>4</sub>, or -Z-Ar'-X-Y-R<sub>4</sub> where Z, Ar, Ar', X, Y, and R<sub>4</sub> are defined as above. In step (1) of Reaction Scheme III, the benzyl group of a benzyloxy-1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XXIV is cleaved to provide a 1*H*-imidazo[4,5-*c*]quinolinol of Formula XXXII. The cleavage is conveniently carried out on a Parr apparatus out under hydrogenolysis conditions using a suitable heterogeneous catalyst such as palladium on carbon in a solvent such as ethanol. The product or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

In step (2) of Reaction Scheme III a 1*H*-imidazo[4,5-*c*]quinolinol of Formula XXXII is converted to an ether-substituted 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula II using a Williamson-type ether synthesis. The reaction is effected by treating a 1*H*-imidazo[4,5-*c*]quinolinol of Formula XXXII with an alkyl or aryl halide of Formula Halide-Z-Ar, Halide-Z-Ar'-Y-R<sub>4</sub>, or Halide-Z-Ar'-X-Y-R<sub>4</sub> in the presence of a base. Numerous alkyl or aryl halides of these formulas are commercially available, including substituted benzyl bromides and chlorides, substituted or unsubstituted arylalkylenyl bromides and chlorides, and substituted fluorobenzenes. Other alkyl or aryl halides of these formulas can be prepared using conventional synthetic methods. The reaction is conveniently carried out by combining a reagent of Formula Halide-Z-Ar, Halide-Z-Ar'-Y-R<sub>4</sub>, or Halide-Z-Ar'-X-Y-R<sub>4</sub> with a 1*H*-imidazo[4,5-*c*]quinolinol of Formula XXXII in a solvent such as DMF in the presence of a suitable base such as

cesium carbonate or potassium carbonate. Optionally, catalytic tetrabutylammonium bromide can be added. The reaction can be carried out at ambient temperature or at an elevated temperature, for example 65 °C or 85 °C, depending on the reactivity of the reagent of Formula Halide-Z-Ar, Halide-Z-Ar'-Y-R<sub>4</sub>, or Halide-Z-Ar'-X-Y-R<sub>4</sub>. The product or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

Alternatively, step (2) may be carried out using the Ullmann ether synthesis, in which an alkali metal aryloxyde of a 1-*H*-imidazo[4,5-*c*]quinolinol of Formula XXXII reacts with an aryl halide in the presence of copper salts, to provide compounds of Formula II, where R<sub>3</sub> is -Z-Ar or -Z-Ar'-Y-R<sub>4</sub>, and Z is a bond.

Step (2) of Reaction Scheme III can alternatively be carried out by treating a 1H-imidazo[4,5-*c*]quinolinol of Formula XXXII with an alcohol of Formula HO-Z-Ar under Mitsunobu reaction conditions. Some alcohols of this formula, such as 3-pyridylcarbinol and 3-furanmethanol, are commercially available, and others can be prepared using conventional synthetic methods. The reaction is conveniently carried out by adding triphenylphosphine and an alcohol of Formula HO-Z-Ar to a solution of a 1H-imidazo[4,5-*c*]quinolinol of Formula XXXII in a suitable solvent such as tetrahydrofuran and then slowly adding diisopropyl azodicarboxylate. The reaction can be carried out at ambient temperature or at a sub-ambient temperature, such as 0 °C. The product can be isolated using conventional methods.

Reaction Scheme III

Compounds of the invention can be prepared according to Reaction Scheme IV, where R, R<sub>1</sub>, R<sub>2</sub>, and n are defined as above and R<sub>3</sub> is -Z-Ar, -Z-Ar'-Y-R<sub>4</sub>, -Z-Ar'-X-Y-R<sub>4</sub>,

where Z, Ar, Ar', X, Y, and R<sub>4</sub> are defined as above. In step (1) of Reaction Scheme IV, the benzyl group of a benzyloxy-1*H*-imidazo[4,5-*c*]quinoline of Formula XXII is cleaved to provide a 1*H*-imidazo[4,5-*c*]quinolinol of Formula XXXIII. The reaction can be carried out as described in step (1) of Reaction Scheme III, or the reaction can be carried out by transfer hydrogenation in the presence of a suitable hydrogenation catalyst. The transfer hydrogenation is conveniently carried out by adding ammonium formate to a solution of a benzyloxy-1*H*-imidazo[4,5-*c*]quinoline of Formula XXII in a suitable solvent such as ethanol in the presence of a catalyst such as palladium on carbon. The reaction is carried out at an elevated temperature, for example, the refluxing temperature of the solvent.

In step (2) of Reaction Scheme IV, a 1*H*-imidazo[4,5-*c*]quinolinol of Formula XXXIII is treated with an alkyl or aryl halide of Formula Halide-Z-Ar, Halide-Z-Ar'-Y-R<sub>4</sub>, or Halide-Z-Ar'-X-Y-R<sub>4</sub> to afford an ether-substituted 1*H*-imidazo[4,5-*c*]quinoline of Formula XI. The reaction can be carried out as described in step (2) of Reaction Scheme III.

In steps (3) and (4) of Reaction Scheme IV, an ether-substituted 1*H*-imidazo[4,5-*c*]quinoline of Formula XI is oxidized to afford a 1*H*-imidazo[4,5-*c*]quinoline-5*N*-oxide of Formula X, which is aminated to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula II. Steps (3) and (4) can be carried out as described in steps (8) and (9), respectively, of Reaction Scheme I. The product or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

## Reaction Scheme IV

Further synthetic elaboration of ether-substituted 1H-imidazo[4,5-c]quinolin-4-amines of Formula II, prepared in Reaction Scheme III or IV, or ether-substituted 1H-imidazo[4,5-c]quinolines of Formula XI, intermediates in Reaction Scheme IV, is possible. For example, a nitro substituent on the aryl or heteroaryl group on a compound of Formula II, where R<sub>3</sub> is -Z-Ar, can be reduced to an amino group using conventional methods. The reduction can be carried out using the methods described in step (6) of Reaction Scheme I. The resulting amino substituent on the aryl or heteroaryl group on a compound of Formula II or XI, where R<sub>3</sub> is -Z-Ar, can be further elaborated as described below.

An amino substituent on the aryl or heteroaryl group on a compound of Formula II or XI, where R<sub>3</sub> is -Z-Ar, can be reacted with an aldehyde to provide an imine that can be reduced using conventional methods to provide a compound of Formula II or XI, wherein R<sub>3</sub> is -Z-Ar'-N(R<sub>8</sub>)-H, and R<sub>8</sub> is as defined above, or a pharmaceutically acceptable salt thereof. A compound of Formula II or XI, where R<sub>3</sub> is -Z-Ar'-N(R<sub>8</sub>)-H can be treated according to the methods described in step (7) or (7a) of Reaction Scheme II to provide a compound of Formula II or XI in which R<sub>3</sub> is -Z-Ar'-N(R<sub>8</sub>)-Q-R<sub>4</sub> or -Z-Ar'-R<sub>5</sub>, wherein Q, R<sub>4</sub>, and R<sub>8</sub> are as defined above and R<sub>5</sub> is

R<sub>6</sub>, R<sub>7</sub>, R<sub>8</sub>, and A are as defined above. A compound of Formula XI, in which R<sub>3</sub> is  
 -Z-Ar'-N(R<sub>8</sub>)-Q-R<sub>4</sub> or -Z-Ar'-R<sub>5</sub>, can be converted into compound of Formula II or a  
 pharmaceutically acceptable salt thereof using the chemistry described in steps (3) and (4)  
 5 in Reaction Scheme IV.

Compounds of Formula II, where R, R<sub>1</sub>, R<sub>2</sub>, and n are defined as above and R<sub>3</sub> is  
 -Z-Ar or -Z-Ar'-Y-R<sub>4</sub>, where Z is a bond, and Ar, Ar', Y, and R<sub>4</sub> are defined as above, may  
 alternatively be prepared as shown in Reaction Scheme V and Reaction Scheme VI  
 wherein Hal is halogen. Step (1) of Reaction Scheme V and Reaction Scheme VI may be  
 10 carried out using the Ullmann ether synthesis, in which an alkali metal aryloxide of an aryl  
 alcohol of Formula ArOH or HOAr-Y-R<sub>4</sub> reacts with a halogen-substituted 1*H*-  
 imidazo[4,5-*c*]quinolin-4-amine of Formula XXXIV or a halogen-substituted 1*H*-  
 imidazo[4,5-*c*]quinoline of Formula XXXV in the presence of copper salts. Many  
 compounds of Formulae XXXIV and XXXV are known. See, for example, U.S. Patents  
 15 4,689,338; 4,929,624; 5,268,376; 5,346,905; 5,389,640; 5,756,746; 6,331,539; 6,451,810;  
 6,541,485; 6,545,016; 6,660,747; 6,683,088; 6,656,938; 6,664,264; and 6,664,260;  
 European Patent Application 1 104 764; and Japanese Patent Application 9-255926.  
 Others can be readily prepared using known synthetic methods. See, for example, U.S.  
 Patent Nos. 4,988,815; 5,175,296; 5,367,076; 5,395,937; and 5,741,908. Several aryl  
 20 alcohols of Formulae ArOH or HOAr-Y-R<sub>4</sub> are known; others can be prepared using  
 known synthetic methods. In Reaction Scheme I, the reaction of a halogen-substituted 1*H*-  
 imidazo[4,5-*c*]quinolin-4-amine of Formula XXXIV under Ullmann conditions would  
 provide an ether-substituted 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula II.

## Reaction Scheme V

In Reaction Scheme VI the reaction of halogen-substituted 1*H*-imidazo[4,5-*c*]quinoline of Formula XXXV would provide an ether-substituted 1*H*-imidazo[4,5-*c*]quinoline of Formula XI. In steps (2) and (3) of Reaction Scheme VI an ether-substituted 1*H*-imidazo[4,5-*c*]quinoline of Formula XI can be oxidized to afford a 1*H*-imidazo[4,5-*c*]quinoline-5*N*-oxide of Formula X, which can be aminated to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula II. Steps (2) and (3) of Reaction Scheme VI can be carried out as described in steps (3) and (4) of Reaction Scheme IV.

## Reaction Scheme VI

Compounds of the invention can be prepared according to Reaction Scheme VII, where Ar, R, R<sub>1</sub>, R<sub>2</sub>, and n are as defined above.

In step (1) of Reaction Scheme VII, a 1*H*-imidazo[4,5-*c*]quinolinol of Formula XXXII is alkylated with a bromide of the Formula  $\text{Br}-(\text{CH}_2)_m-\text{C}\equiv\text{CH}$  to provide a 1*H*-imidazo[4,5-*c*]quinolinyl ether of Formula XXXVI. The compound of Formula XXXII and the bromide are combined in a suitable solvent such as DMF in the presence of cesium carbonate. The reaction can be run at ambient temperature.

In step (2) of Reaction Scheme VII, a 1*H*-imidazo[4,5-*c*]quinoline of Formula XXXVI is coupled with a halide of the Formula halide-Ar using Sonogashira reaction conditions to provide a 1*H*-imidazo[4,5-*c*]quinoline of Formula IIa, which is a subgenus of Formula II. A compound of the Formula XXXVI is combined with the halide in the presence of copper (I) iodide, dichlorobis(triphenylphosphine)palladium(II), and excess triethylamine in a suitable solvent such as DMF. The reaction is preferably carried out at an elevated temperature (60-80 °C).

In step (3) of Reaction Scheme VII, the alkyne bond of a 1*H*-imidazo[4,5-*c*]quinoline of Formula IIa is reduced to provide a 1*H*-imidazo[4,5-*c*]quinoline of Formula IIb, which is a subgenus of Formula II. The reduction can be carried out by hydrogenation using a conventional heterogeneous hydrogenation catalyst such as palladium on carbon. The hydrogenation is conveniently carried out in a Parr apparatus in a suitable solvent such as ethanol. The reaction can be run at ambient temperature. The product or a pharmaceutically acceptable salt thereof can be isolated using conventional methods.

## Pharmaceutical Compositions and Biological Activity

Pharmaceutical compositions of the invention contain a therapeutically effective amount of a compound of the invention as described above in combination with a pharmaceutically acceptable carrier.

10

The term "a therapeutically effective amount" or "effective amount" means an amount of the compound sufficient to induce a therapeutic or prophylactic effect, such as cytokine induction, cytokine inhibition, immunomodulation, antitumor activity, and/or antiviral activity. Although the exact amount of active compound used in a pharmaceutical composition of the invention will vary according to factors known to those of skill in the art, such as the physical and chemical nature of the compound, the nature of the carrier, and the intended dosing regimen, it is anticipated that the compositions of the invention will contain sufficient active ingredient to provide a dose of about 100 nanograms per kilogram (ng/kg) to about 50 milligrams per kilogram (mg/kg), preferably

15

about 10 micrograms per kilogram ( $\mu\text{g/kg}$ ) to about 5 mg/kg, of the compound to the subject. A variety of dosage forms may be used, such as tablets, lozenges, capsules, parenteral formulations, syrups, creams, ointments, aerosol formulations, transdermal patches, transmucosal patches and the like.

5           The compounds of the invention can be administered as the single therapeutic agent in the treatment regimen, or the compounds of the invention may be administered in combination with one another or with other active agents, including additional immune response modifiers, antivirals, antibiotics, antibodies, proteins, peptides, oligonucleotides, etc.

10           Compounds of the invention have been shown to induce, and certain compounds of the invention may inhibit, the production of certain cytokines in experiments performed according to the tests set forth below. These results indicate that the compounds are useful as immune response modifiers that can modulate the immune response in a number of different ways, rendering them useful in the treatment of a variety of disorders.

15           Cytokines whose production may be induced by the administration of compounds according to the invention generally include interferon- $\alpha$  (IFN- $\alpha$ ) and/or tumor necrosis factor- $\alpha$  (TNF- $\alpha$ ) as well as certain interleukins (IL). Cytokines whose biosynthesis may be induced by compounds of the invention include IFN- $\alpha$ , TNF- $\alpha$ , IL-1, IL-6, IL-10 and IL-12, and a variety of other cytokines. Among other effects, these and other cytokines  
20           can inhibit virus production and tumor cell growth, making the compounds useful in the treatment of viral diseases and neoplastic diseases. Accordingly, the invention provides a method of inducing cytokine biosynthesis in an animal comprising administering an effective amount of a compound or composition of the invention to the animal. The animal to which the compound or composition is administered for induction of cytokine  
25           biosynthesis may have a disease as described *infra*, for example a viral disease or a neoplastic disease, and administration of the compound may provide therapeutic treatment. Alternatively, the compound may be administered to the animal prior to the animal acquiring the disease so that administration of the compound may provide a prophylactic treatment.

30           In addition to the ability to induce the production of cytokines, compounds of the invention may affect other aspects of the innate immune response. For example, natural

killer cell activity may be stimulated, an effect that may be due to cytokine induction. The compounds may also activate macrophages, which in turn stimulate secretion of nitric oxide and the production of additional cytokines. Further, the compounds may cause proliferation and differentiation of B-lymphocytes.

5           Compounds of the invention can also have an effect on the acquired immune response. For example, the production of the T helper type 1 (T<sub>H</sub>1) cytokine IFN- $\gamma$  may be induced indirectly and the production of the T helper type 2 (T<sub>H</sub>2) cytokines IL-4, IL-5 and IL-13 may be inhibited upon administration of the compounds.

10           Other cytokines whose production may be inhibited by the administration of certain compounds according to the invention include tumor necrosis factor- $\alpha$  (TNF- $\alpha$ ). Among other effects, inhibition of TNF- $\alpha$  production can provide prophylaxis or therapeutic treatment of diseases in animals in which TNF is mediated, making the compounds useful in the treatment of, for example, autoimmune diseases. Accordingly, the invention provides a method of inhibiting TNF- $\alpha$  biosynthesis in an animal comprising  
15           administering an effective amount of a compound or composition of the invention to the animal. The animal to which the compound or composition is administered for inhibition of TNF- $\alpha$  biosynthesis may have a disease as described *infra*, for example an autoimmune disease, and administration of the compound may provide therapeutic treatment. Alternatively, the compound may be administered to the animal prior to the animal  
20           acquiring the disease so that administration of the compound may provide a prophylactic treatment.

25           Whether for prophylaxis or therapeutic treatment of a disease, and whether for effecting innate or acquired immunity, the compound or composition may be administered alone or in combination with one or more active components as in, for example, a vaccine adjuvant. When administered with other components, the compound and other component or components may be administered separately; together but independently such as in a solution; or together and associated with one another such as (a) covalently linked or (b) non-covalently associated, e.g., in a colloidal suspension.

30           Conditions for which IRMs identified herein may be used as treatments include, but are not limited to:

#### Part A

The preparation of 7-benzyloxy-*N*<sup>4</sup>-(2-methylpropyl)quinoline-3,4-diamine is described in Parts A-F of Example 1. An analysis by thin layer chromatography (TLC) indicated the reaction was incomplete, and additional mCPBA was added. The solution was stirred until the reaction was complete as determined by TLC and then washed with saturated aqueous sodium bicarbonate, dried over magnesium sulfate, filtered, and concentrated under reduced pressure. The residue was used without purification.

7-(4-Aminophenoxy)-1-(2-methylpropyl)-2-propyl-1*H*-imidazo[4,5-*c*]quinolin-4-amine

5           Nickel(II)chloride (0.044 g, 0.34 mmol) was added to a solution of 1-(2-methylpropyl)-7-(4-nitrophenoxy)-2-propyl-1*H*-imidazo[4,5-*c*]quinolin-4-amine (0.436 g, 1.04 mmol), prepared as described in Example 35, in 20:80 dichloromethane:methanol (30 mL). Sodium borohydride (0.300 g) was added in small portions to the resulting solution, and the reaction was stirred for 25 minutes. A solid formed in the reaction and was removed by filtration, and the filtrate was concentrated under reduced pressure. The residue was dissolved in chloroform, and the resulting solution was washed with water. The organic solution was stirred with AMBERLITE IRA-756 ion exchange resin for 30 minutes, and the resin was then removed by filtration. The filtrate was concentrated under reduced pressure to provide a brown oil, which was purified by flash chromatography using a 10 g silica gel cartridge (RediSep, ISCO, 230-400 mesh) attached to a gradient pump system, 254 nm UV detector and fraction collector (ISCO COMBIFLASH Sg100c system). The column was equilibrated with 1% methanol in dichloromethane and the reaction mixture was injected onto the column. The mixture was eluted at 35 mL/minute, with a linear gradient program consisting of 1% methanol/dichloromethane to 5 % methanol/dichloromethane over five minutes and holding at 5% methanol/dichloromethane to elute the desired compound. Fractions were examined by TLC and those containing the desired compound were combined and concentrated. The product was then recrystallized from acetonitrile to yield 0.242 g of 7-(4-aminophenoxy)-1-(2-methylpropyl)-2-propyl-1*H*-imidazo[4,5-*c*]quinolin-4-amine as a tan, crystalline solid, mp 190-191 °C.

#### Part A

Triethylamine (8.93 mL, 64.1 mmol) was added to a solution of 7-benzyloxy-4-chloro-3-nitroquinoline (13.45 g, 42.7 mmol), prepared in Parts A-D of Example 1, in dichloromethane (250 mL). 2-Phenoxyethylamine (6.15 mL, 47.0 mmol) was added dropwise over a period of ten minutes, and the reaction mixture was stirred for three hours at ambient temperature. Distilled water (200 mL) was added to the solution, and the aqueous layer was washed with dichloromethane (2 x 200 mL). #### Part B

(7-Benzyloxy-3-nitroquinolin-4-yl)-(2-phenoxyethyl)amine (14.24 g, 34.28 mmol) was dissolved in toluene (900 mL) with heating and added to a Parr vessel charged with 5% platinum on carbon (6.7 g, 34.28 mmol) and toluene (100 mL). The vessel was placed under hydrogen pressure (35 psi,  $2.4 \times 10^5$  Pa) and shaken for two hours. The catalyst was removed by filtration and washed with hexanes and dichloromethane. The filtrate was concentrated under reduced pressure, and the residue was recrystallized from methanol, isolated by filtration, washed with hexanes, and dried under high vacuum to provide 13.82 g of 7-benzyloxy-*N*<sup>4</sup>-(2-phenoxyethyl)quinoline-3,4-diamine as a solid.

#### Part C

Under a nitrogen atmosphere, diethoxymethyl acetate (3.0 mL, 18 mmol) was added dropwise to a solution of 7-benzyloxy-*N*<sup>4</sup>-(2-phenoxyethyl)quinoline-3,4-diamine (3.0 g, 7.8 mmol) in toluene (30 mL), and the reaction was heated at reflux for three hours. The reaction mixture was concentrated under reduced pressure until a small volume of solvent remained. Hexanes were added, and the resulting mixture was cooled for 20 minutes in a refrigerator. A precipitate formed which was isolated by filtration, washed with hexanes, and dried overnight under reduced pressure to provide 3.12 g of 7-benzyloxy-1-(2-phenoxyethyl)-1*H*-imidazo[4,5-*c*]quinoline as a solid.

## 10 Part B

Under a nitrogen atmosphere, a solution of the material from Part A and triethylamine (5.02 g, 49.6 mmol) in dichloromethane was cooled to ~0 °C, and methoxyethoxyacetyl chloride (6.99 g, 45.8 mmol) was slowly added. #### Part B

Under a nitrogen atmosphere, a 0.08 M solution of 2-butyl-1-methyl-1*H*-imidazo[4,5-*c*]quinolin-8-ol (1 equivalent, ~1 g) in DMF was heated at 85 °C until it was homogeneous. Solid cesium carbonate (2 equivalents) was heated, and the reaction was stirred at 85 °C for 20-40 minutes. The heat was removed, and a solution of the alkyl bromide indicated in the table below (1.2 equivalents) in DMF (5-10 mL) was added. The reaction was stirred at 85 °C for between two and 45 hours or until an analysis by TLC indicated the starting material was consumed. Optionally, methanol (1-2 mL) was added, and the reaction mixture was filtered to remove solids. The volatiles were removed under reduced pressure, and the residue was dissolved in ethyl acetate. The resulting solution was washed with water and concentrated under reduced pressure to provide a solid.

#### Part C

Over a period of 20 minutes, mCPBA (1 equivalent, 65% pure) was added in four portions to a 0.05-0.1 M solution of the material from Part B (1 equivalent) in chloroform. For Example 61, a 1.5:1 mixture of chloroform and DMF was used as the solvent. The reaction was stirred at ambient temperature for between four and 28 hours, and optionally additional mCPBA was added in small portions until an analysis by TLC indicated that the starting material was consumed. The solution was then washed with saturated aqueous sodium bicarbonate and concentrated under reduced pressure. For Example 66, the reaction product was purified by column chromatography on silica gel (eluting with 90:10

dichloromethane:methanol). A description of the last step in the synthesis, the purification, and the characterization for each Example follows the table.

10       A modification of the general procedure described in Part B of Example 46 was followed using (6-benzyloxy-3-nitroquinolin-4-yl)-(2-methylpropyl)amine (4.6 g, 14 mmol) in lieu of (7-benzyloxy-3-nitroquinolin-4-yl)-(2-phenoxyethyl)amine. The reaction was maintained under hydrogen pressure for four hours, and the reaction mixture was  
15       filtered through a layer of CELITE filter aid. After the filter cake was washed with toluene, the filtrate was concentrated to a volume of 100 mL.

## Part C

20       Triethyl orthoformate (2.55 g, 17.2 mmol) and a catalytic amount of pyridine hydrochloride were added to the solution from Part B. The reaction was heated at reflux for five hours, allowed to cool to room temperature, and stirred overnight. The reaction mixture was then cooled, and a precipitate formed. The precipitate was isolated by filtration and washed with hexanes to provide 3.74 g of 8-benzyloxy-1-(2-methylpropyl)-1*H*-imidazo[4,5-*c*]quinoline as a pale yellow solid, mp 129-133 °C.

### Example 69

8-Benzyloxy-2-methyl-1-[5-(methylsulfonyl)pentyl]-1*H*-imidazo[4,5-*c*]quinolin-4-amine

#### Part A

A modification of the general method described in Part A of Example 46 was followed using 6-benzyloxy-4-chloro-3-nitroquinoline (10.5 g, 34 mmol), prepared as described in Parts A-D of Example 57, in lieu of 7-benzyloxy-4-chloro-3-nitroquinoline and 5-amino-1-pentanol (3.5 g, 34 mmol) in lieu of 2-phenoxyethylamine. The reaction was heated at reflux for two hours and then allowed to cool to ambient temperature slowly and stirred overnight. An analysis by TLC indicated the presence of starting material, and additional 5-amino-1-pentanol (0.2 equivalent) was added. The reaction was heated at reflux until the reaction was complete as indicated by TLC. Following the work-up, the crude product was purified by column chromatography on silica gel (eluting with 95:5 dichloromethane:methanol) to provide 5.95 g of 5-{[6-(benzyloxy)-3-nitroquinolin-4-yl]amino}pentan-1-ol as a yellow solid.

heated at reflux for 1.5 hours, at which time a yellow precipitate formed. The volatiles were removed under reduced pressure, and the residue was partitioned between dilute aqueous sodium carbonate (100 mL) and dichloromethane (150 mL). The aqueous layer was washed with dichloromethane (50 mL), and the combined organic solutions were washed with brine (50 mL), dried over sodium sulfate, filtered, and concentrated under reduced pressure to provide 6.24 g of 6-benzyloxy-*N*-(5-chloropentyl)-3-nitroquinolin-4-amine as a yellow oil.

#### Part C

Under a nitrogen atmosphere, solid sodium thiomethoxide (1.38 g, 18.7 mmol, 95% pure) was added to a solution of 6-benzyloxy-*N*-(5-chloropentyl)-3-nitroquinolin-4-amine (6.24 g, 15.6 mmol) in DMF. The reaction was stirred at ambient temperature for 30 minutes and then heated at 80 °C for one hour, at which time a yellow precipitate formed. The reaction mixture was partitioned between water (390 mL) and dichloromethane (150 mL). The aqueous layer was washed with dichloromethane (100 mL), and the combined organic fractions were washed with saturated aqueous sodium bicarbonate (100 mL) and brine (100 mL), dried over sodium sulfate, filtered, and concentrated under reduced pressure to provide a red oil. An analysis by nuclear magnetic resonance spectroscopy indicated the presence of a large amount of starting material. The reaction product was dissolved in DMF (78 mL), treated with sodium thiomethoxide, and heated at reflux for two hours. The work-up described above was repeated, and the crude product was purified by column chromatography on silica gel (eluting with 70:30 ethyl acetate:hexane) to provide 5.1 g of 6-benzyloxy-*N*-[5-(methylthio)pentyl]-3-nitroquinolin-4-amine as a yellow oil.

#### Part D

A modification of the general method described in Part B of Example 46 was followed using 6-benzyloxy-*N*-[5-(methylthio)pentyl]-3-nitroquinolin-4-amine (5.1 g, 12 mmol) in lieu of (7-benzyloxy-3-nitro-quinolin-4-yl)-(2-phenoxyethyl)amine. The reaction was maintained under hydrogen pressure (49 psi,  $3.4 \times 10^5$  Pa) for three hours. The reaction mixture was filtered through a layer of CELITE filter aid, and the filter cake was washed with methanol (100 mL) and chloroform (50 mL). The filtrate was concentrated under reduced pressure to provide 6-benzyloxy-*N*<sup>4</sup>-[5-

(methylthio)pentyl]quinoline-3,4-diamine as a yellow oil, which was used without purification.

#### Part E

Trimethyl orthoacetate (1.7 mL, 14 mmol) was added to a solution of the material from Part D in toluene (41 mL). Pyridine hydrochloride (0.1 g) was then added, and the reaction was heated at reflux for one hour. A Dean-Stark trap was used to collect the volatiles. The reaction was allowed to cool to ambient temperature, and the solvent was removed under reduced pressure. The crude product was purified by column chromatography on silica gel (eluting with 95:5 dichloromethane:methanol) to provide 5.03 g of 8-benzyloxy-2-methyl-1-[5-(methylthio)pentyl]-1*H*-imidazo[4,5-*c*]quinoline as a white solid.

#### Part F

Over a period of 13 minutes, mCPBA (6.2 g, 27 mmol, 75% pure) was added in portions to a solution of 8-benzyloxy-2-methyl-1-[5-(methylthio)pentyl]-1*H*-imidazo[4,5-*c*]quinoline (3.3 g, 8.1 mmol) in chloroform (41 mL). The reaction was stirred for 15 minutes, and then a precipitate formed. Additional chloroform (41 mL) was added, but the precipitate did not dissolve. Ammonium hydroxide (40 mL) and *p*-toluenesulfonyl chloride were then added to the mixture, and the reaction was stirred for ten minutes. The aqueous layer was washed with dichloromethane (2 x 50 mL), and the combined organic solutions were concentrated under reduced pressure to yield a red, semi-solid. The solid was purified by column chromatography on silica gel (eluting with 90:10 dichloromethane:methanol) and recrystallized from methanol (80 mL/g) to provide 1.4 g of 8-benzyloxy-2-methyl-1-[5-(methylsulfonyl)pentyl]-1*H*-imidazo[4,5-*c*]quinolin-4-amine as colorless needles, mp 215-217 °C.

## Examples 70-73

## Part A

A solution of 6-benzyloxy-4-chloro-3-nitroquinoline (14.47 g, 46.29 mmol), prepared in Parts A-D of Example 57, and triethylamine (8.4 mL, 60.2 mmol) in dichloromethane (200 mL) was cooled to 0 °C. *tert*-Butyl *N*-(4-aminobutyl)carbamate (8.71 g, 46.3 mmol) was added; the reaction was stirred for 15 minutes at 0 °C and then allowed to warm to ambient temperature and stirred for five hours. An analysis by TLC indicated the presence of starting material; therefore, additional *tert*-butyl *N*-(4-aminobutyl)carbamate (0.5 mL, 2.6 mmol) was added. The reaction was stirred overnight and then washed with water (2 x 200 mL). The combined washings were extracted with chloroform after the addition of sodium chloride. The combined organic solutions were dried over sodium sulfate, filtered, and concentrated under reduced pressure. The crude product was recrystallized from ethyl acetate (100 mL). The crystals were isolated by filtration and washed with cold hexanes to provide 17.62 g of *tert*-butyl [4-(6-benzyloxy-3-nitroquinolin-4-ylamino)butyl]carbamate as an orange powder.

## Part B

*tert*-Butyl [4-(6-benzyloxy-3-nitroquinolin-4-ylamino)butyl]carbamate (17.62 g, 37.77 mmol) was dissolved in toluene (600 mL) with heating and added to a Parr vessel charged with 5% platinum on carbon (2.20 g). The vessel was placed under hydrogen pressure (30 psi,  $2.1 \times 10^5$  Pa) for three hours. The reaction mixture was filtered through a layer of CELITE filter aid, and the filtrate was concentrated under reduced pressure to provide 15.5 g of *tert*-butyl {4-[3-amino-6-(benzyloxy)quinolin-4-ylamino]butyl}carbamate as a brown solid.

## Part C

For Examples 70-72, the following procedure was used. Under a nitrogen atmosphere, the reagent from the table below (1.5 equivalents) and pyridine hydrochloride (0.01-0.02 equivalents) were added to a solution of *tert*-butyl {4-[3-amino-6-(benzyloxy)quinolin-4-ylamino]butyl}carbamate (29-36 mmol, 1 equivalent) in toluene (200 mL), and the reaction was heated at reflux for three to five hours. The toluene was removed under reduced pressure. The residue was dissolved in a small amount of toluene, which was removed under reduced pressure. This was repeated three times. The resulting

solid was dried under high vacuum at 100 °C to provide the *tert*-butyl {4-(8-benzyloxy-1*H*-imidazo[4,5-*c*]quinolin-1-yl)butyl} carbamate with the substituent indicated in the table below.

For Example 73, a modification of the general method described for Part C of Example 50 was followed using *tert*-butyl {4-[3-amino-6-(benzyloxy)quinolin-4-ylamino]butyl} carbamate (9.25 g, 21.2 mmol) in lieu of *tert*-butyl {4-[3-amino-7-(benzyloxy)quinolin-4-ylamino]butyl} carbamate and ethoxyacetyl chloride (2.86 g, 23.3 mmol) in lieu of methoxypropionyl chloride. After the cyclization reaction, the solvent was removed under reduced pressure, and the residue was dissolved in chloroform (400 mL). The resulting solution was washed with water (2 x 200 mL) and brine (1 x 200 mL), concentrated under reduced pressure, and dried under high vacuum to provide a brown oil. The crude product was purified by column chromatography on silica gel (400 g, eluting with 95:5 dichloromethane:methanol). The resulting solid was triturated with diethyl ether and isolated by filtration to provide 5.37 g of *tert*-butyl {4-(8-benzyloxy-2-ethoxymethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl)butyl} carbamate as an off-white powder.

#### Part D

mCPBA (1 equivalent, 60% pure) was added to a 0.1 M solution of the material from Part C (1 equivalent) in chloroform. The reaction was stirred under a nitrogen atmosphere overnight. During the reaction additional mCPBA was added if the reaction had appeared to stall. The reaction was then washed with 1% aqueous sodium carbonate (2-3 x) and brine (1 x), dried over sodium sulfate, filtered, and concentrated under reduced pressure.

#### Part E

Excess ammonium hydroxide and *p*-toluenesulfonyl chloride (1 equivalent) were added to a 0.5-2 M solution of the material from Part D (1 equivalent) in dichloroethane. The reaction was heated at 70 °C for one to two hours and then allowed to cool to room temperature. The organic solution was washed with 1% aqueous sodium carbonate (3 x), dried over sodium sulfate, filtered, and concentrated under reduced pressure. For Examples 70, 71, and 73, the material was used without purification. For Example 72, the crude product was purified by column chromatography on silica gel (eluting sequentially with 92.5:7.5 dichloromethane:methanol and 90:10 dichloromethane:methanol).

## Part F

A modification of the general method described in Part F of Example 50 was followed. A solution of the material from Part E and hydrochloric acid in ethanol was heated at reflux for 30 minutes to two hours. The salt obtained from the reaction was dissolved in water, and the aqueous solution was washed with chloroform. Concentrated ammonium hydroxide was added to the aqueous solution until the pH was basic. Ethoxyacetyl chloride (5.37 g, 43.8 mmol) was added to a solution of 1-{[3-amino-6-(benzyloxy)quinoline-4-yl]amino}-2-methylpropan-2-ol (7.45 g, 22.1 mmol) in acetonitrile (230 mL), and the reaction was stirred overnight. The solvent was removed under reduced pressure, and the residue was dissolved in dichloromethane. The resulting solution was washed with aqueous sodium bicarbonate, dried over magnesium sulfate, filtered, and concentrated under reduced pressure. The residue was purified by column chromatography on a HORIZON HPFC system (an automated, modular high-performance flash purification product available from Biotage, Inc, Charlottesville, Virginia, USA) (silica gel cartridge, eluting with dichloromethane:methanol ranging in ratios from 98:2 to 95:5) to provide *N*-{6-benzyloxy-4-[(2-hydroxy-2-methylpropyl)amino]quinolin-3-yl}-2-ethoxyacetamide hydrochloride.

### Example 133

2-Ethoxymethyl-1-propyl-8-(pyridin-3-ylmethoxy)-1*H*-imidazo[4,5-*c*]quinolin-4-amine

#### 10 Part A

2-Ethoxymethyl-1-propyl-1*H*-imidazo[4,5-*c*]quinolin-8-ol was prepared by treating 8-benzyloxy-2-ethoxymethyl-1-propyl-1*H*-imidazo[4,5-*c*]quinoline, prepared in Parts A-F of Example 150, according to the method described in Example 5.

15 2-Ethoxymethyl-1-propyl-1*H*-imidazo[4,5-*c*]quinolin-8-ol (680 mg, 2.38 mmol) was dissolved in dichloromethane and mCPBA (60%, 750 mg, 2.62 mmol) was added. The reaction was monitored by TLC and when all of the starting material was determined to be consumed, 20 mL of 2% aqueous sodium carbonate was added. The organic layer was extracted with 2 additional portions of 2% sodium carbonate. The aqueous fractions were combined and concentrated hydrochloric acid was added dropwise until the pH  
20 reached 1. The pH was then adjusted to 5 with the portionwise addition of 2% sodium carbonate. A precipitate formed and was collected by filtration to give crude 2-ethoxymethyl-5-oxido-1-propyl-1*H*-imidazo[4,5-*c*]quinolin-8-ol as an off-white powder. The solid was combined in 50 mL of anhydrous THF with triphenylphosphine (1.2 g, 4.76 mmol) and pyridine-3-methanol (390 mg, 3.57 mmol). Diisopropyl azodicarboxylate (1.2  
25 g, 5.95 mmol) was added dropwise. After 4 hours, additional portions of

triphenylphosphine and pyridine-3-methanol followed by diisopropylidicarboxylate were added and the reaction was stirred for one hour. Water (1 mL) was added and the reaction stirred overnight. The reaction mixture was concentrated under reduced pressure and the resulting solid was dissolved in dichloromethane and washed 3 times with 50 mL portions of 2% aqueous sodium carbonate. The aqueous fractions were combined and extracted with chloroform. The organic fractions were combined, dried over magnesium sulfate, filtered, and concentrated to give crude 2-ethoxymethyl-5-oxido-1-propyl-8-(pyridin-3-ylmethoxy)-1*H*-imidazo[4,5-*c*]quinoline.

#### Part B

The crude 2-ethoxymethyl-5-oxido-1-propyl-8-(pyridin-3-ylmethoxy)-1*H*-imidazo[4,5-*c*]quinoline from Part A was dissolved in 50 mL of dichloromethane and trichloroacetyl isocyanate (540 mg, 2.85 mmol) was added dropwise. The reaction was monitored by thin layer chromatography and once the starting material was consumed, 2 mL of concentrated ammonium hydroxide was added. The reaction was stirred for 30 minutes and then passed through a column containing cation-exchange resin. The column was washed with methanol to remove impurities followed by elution of the desired product from the column with 2M ammonia in methanol. The volatiles were removed under reduced pressure. The resulting residue was dissolved in dichloromethane and purified by column chromatography on a HORIZON HPFC system. A silica gel cartridge was used eluting with a gradient of 0-8% methanol in dichloromethane. The solid was further purified by recrystallization from acetonitrile to give 2-ethoxymethyl-1-propyl-8-(pyridin-3-ylmethoxy)-1*H*-imidazo[4,5-*c*]quinolin-4-amine as light amber crystals, mp 190.0-191.0 °C.

*N*-[2-(4-Amino-8-benzyloxy-2-ethoxymethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl)-1,1-dimethylethyl]methanesulfonamide

## 5 Part A

(2-Amino-2-methylpropyl)-(6-benzyloxy-3-nitroquinolin-4-yl)amine was prepared according to the method described in Part A of Example 52, using 6-benzyloxy-4-chloro-3-nitroquinoline in lieu of 7-benzyloxy-4-chloro-3-nitroquinoline.

(2-Amino-2-methylpropyl)(6-benzyloxy-3-nitroquinolin-4-yl)amine (24.33 g, 66.4 mmol) was stirred in 400 mL of THF and sodium hydroxide (2.92 g in 100 mL of water) was added. Next, 17.40 g of di-*tert*-butyl dicarbonate in 100 mL of THF was added dropwise and the reaction was stirred overnight at ambient temperature. The THF was removed under reduced pressure and dichloromethane and water were added. The organic fraction was separated from the aqueous fraction. The organic fraction was then sequentially washed with water followed by brine; dried over sodium sulfate and magnesium sulfate; filtered; and concentrated under reduced pressure to yield 31.05 g of crude *tert*-butyl [2-(6-benzyloxy-3-nitroquinolin-4-ylamino)-1,1-dimethylethyl]carbamate as a brown foam.

## Part B

*tert*-Butyl [2-(6-benzyloxy-3-nitroquinolin-4-ylamino)-1,1-dimethylethyl]carbamate (13.75 g), 5% platinum on carbon (1.03 g), and acetonitrile (250 mL) were combined. The mixture was shaken overnight under 50 psi ( $3.4 \times 10^5$  Pa) of hydrogen. The reaction was filtered through CELITE filter agent, and the filter pad was rinsed with acetonitrile. The filtrate was concentrated under reduced pressure. Residual water was removed by an azeotrope with toluene. Removal of all volatiles under reduced

pressure provided 13.34 g of crude *tert*-butyl [2-(3-amino-6-benzyloxyquinolin-4-ylamino)-1,1-dimethylethyl]carbamate as a brown foam.

#### Part C

Ethoxyacetyl chloride (3.5 mL, 32.0 mmol) was added to a solution of *tert*-butyl [2-(3-amino-6-benzyloxyquinolin-4-ylamino)-1,1-dimethylethyl]carbamate (12.71 g, 29.1 mmol) and triethylamine (8.1 mL, 58.2 mmol) in approximately 250 mL of anhydrous dichloromethane. After stirring for 2 hours, the volatiles were removed under reduced pressure and the resulting brown residue was dissolved in ethanol, followed by the addition of 8.1 mL of triethylamine. The reaction was heated at reflux for 2.5 days and then cooled to ambient temperature. The solvent was removed under reduced pressure and dichloromethane was added. The solution was sequentially washed with aqueous sodium bicarbonate (2X) followed by brine; dried over sodium sulfate; filtered, and concentrated under reduced pressure. The residue was purified by column chromatography on a HORIZON HPFC system. A silica gel cartridge was used eluting with a gradient of 0-15% CMA in chloroform to provide 8.4 g of *tert*-butyl [2-(8-benzyloxy-2-ethoxymethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl)-1,1-dimethylethyl]carbamate as an orange foam.

#### Part D

A 50 mL solution of HCl in ethanol (4.3 M) was added to a solution of *tert*-butyl [2-(8-benzyloxy-2-ethoxymethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl)-1,1-dimethylethyl]carbamate (8.4 g, 16.6 mmol) in ethanol (50 mL) and heated at reflux temperature for 1 hour. The reaction was cooled to ambient temperature and nitrogen was bubbled through the solution. The solvent was removed under reduced pressure and water was added to the residue. The solution was made basic and then extracted with three portions of dichloromethane. The combined organic fractions were washed with brine, dried over sodium sulfate, filtered, and concentrated to yield 6.26 g of 2-(8-benzyloxy-2-ethoxymethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl)-1,1-dimethylethylamine as a brown solid.

#### Part E

2-(8-Benzyloxy-2-ethoxymethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl)-1,1-dimethylethylamine (2.19 g, 5.4 mmol), triethylamine (1.5 mL, 10.8 mmol), and dichloromethane (50 mL) were combined. Methanesulfonic anhydride (1.04 g, 6.0 mmol) was added and the reaction was stirred overnight. Analysis by thin layer chromatography

indicated that the reaction was not complete. An additional 0.2 g of methanesulfonic anhydride was added and the reaction was stirred for 2 more hours. Saturated sodium bicarbonate was added and the layers were separated. The organic fraction was sequentially washed with a second portion of saturated sodium bicarbonate and then brine; dried over sodium sulfate; filtered; and concentrated under reduced pressure to provide an orange foam. The residue was purified by column chromatography on a HORIZON HPFC system. A silica gel cartridge was used eluting with a gradient of 0-20% CMA in chloroform to provide 2.37 g of *N*-[2-(8-benzyloxy-2-ethoxymethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl)-1,1-dimethylethyl]methanesulfonamide as a white solid.

#### Part F

mCPBA (60% pure, 1.45 g,) was added to a solution of *N*-[2-(8-benzyloxy-2-ethoxymethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl)-1,1-dimethylethyl]methanesulfonamide (2.37 g, 4.91 mmol) in chloroform (100 mL). The reaction was stirred for 2 hours and quenched by adding 50 mL of aqueous 2% sodium carbonate. The layers were separated and the aqueous fraction was extracted with two portions of chloroform. The combined organic fractions were washed with brine, dried over sodium sulfate, filtered, and concentrated to give 2.29 g of crude *N*-[2-(8-benzyloxy-2-ethoxymethyl-5-oxido-1*H*-imidazo[4,5-*c*]quinolin-1-yl)-1,1-dimethylethyl]methanesulfonamide as an orange foam.

#### Part G

*N*-[2-(8-Benzyloxy-2-ethoxymethyl-5-oxido-1*H*-imidazo[4,5-*c*]quinolin-1-yl)-1,1-dimethylethyl]methanesulfonamide (2.29 g, 4.59 mmol) was suspended in dichloromethane (75 mL) and trichloroacetyl isocyanate (0.71 mL, 5.97 mmol) was added dropwise. After stirring for 1 hour, the volatiles were removed under reduced pressure. The resulting orange residue was dissolved in methanol (75 mL) and 6 mL of sodium methoxide (21% in methanol) was added. The reaction was stirred for two additional hours and then the methanol was removed under reduced pressure. The residue was dissolved in dichloromethane and washed with water followed by brine. The organic fraction was dried over sodium sulfate, filtered and concentrated under reduced pressure to give an orange foam. The residue was purified by column chromatography on a HORIZON HPFC system. A silica gel cartridge was used eluting with a gradient of 10-30% CMA in chloroform to provide 1.88 g of *N*-[2-(4-amino-8-benzyloxy-2-

The mixture was shaken overnight under 50 psi (3.4 x 10<sup>5</sup> Pa) of hydrogen. Dichloromethane (100 mL) and methanol (100 mL) were added and reaction was filtered through CELITE filter agent. A solution of 4-benzyloxyaniline (84.8 g, 0.43 mol) in methanol (150 mL) was slowly added to the reaction over a period 1 hour while maintaining the reaction temperature between 57-60 °C. The reaction was cooled to 45 °C and stirred vigorously for 1.5 hours, allowed to cool to room temperature, and then stirred overnight. The reaction mixture was cooled to 1 °C, and the product was isolated by filtration. The solid was washed with cold ethanol (~400 mL) until the filtrate was colorless. 5-[[4-Benzyloxy)phenylimino]methyl]-2,2-dimethyl-[1,3]-dioxane-4,6-dione (142.4 g, wet with residual solvent) was isolated as a tan powder.

## Part B

15 A solution of 5-[[4-benzyloxy)phenylimino]methyl]-2,2-dimethyl-[1,3]-dioxane-4,6-dione (127.2 g) and DOWTHERM A (500 mL) heat transfer fluid was heated to 100 °C and then slowly added to a flask containing DOWTHERM A heat transfer fluid (1 L, heated at 250 °C) over a period of 90 minutes. During the addition, the reaction temperature was not allowed to fall below 245 °C. Following the addition, the reaction was stirred at 250 °C for 30 minutes, and then allowed to cool to ambient temperature. ### Examples 228-235

#### Part A

10            Ammonium hydroxide (1 L) was added to a solution of methyl tetrahydro-2*H*-pyran-4-carboxylate (20 mL, 150 mmol) in methanol (500 mL), and the reaction was stirred overnight at ambient temperature. Additional ammonium hydroxide (500 mL) was added, and the reaction was stirred for four additional days. The methanol was removed under reduced pressure. Solid sodium chloride was added to the aqueous layer, which was  
15     extracted with chloroform (3 x 150 mL). The combined extracts were dried over sodium sulfate, filtered, and concentrated under reduced pressure to provide 11.4 g of tetrahydro-2*H*-pyran-4-carboxamide as a white solid.

#### Part B

20            A solution of tetrahydro-2*H*-pyran-4-carboxamide (11.4 g, 88.3 mmol) in THF (441 mL) was cooled to 0 °C. Lithium aluminum hydride (10.0 g, 265 mmol) was added in six portions over a period of ten minutes. The reaction flask was purged with nitrogen between the additions. When the reaction mixture was no longer bubbling, it was heated at reflux for six hours. The reaction was then cooled to 0 °C, and ethyl acetate was added dropwise until bubbling ceased. Methanol was then added dropwise until bubbling ceased.  
25     Water (10 mL), 15% aqueous sodium hydroxide (10 mL), and water (30 mL) were sequentially added. The organic fraction was decanted off, and the remaining gray solid was washed with chloroform. The combined organic fractions were dried over sodium sulfate, filtered, and concentrated under reduced pressure to provide tetrahydro-2*H*-pyran-4-ylmethylamine.

## Part C

The method described in Part E of Example 1 can be used to treat 7-benzyloxy-4-chloro-3-nitroquinoline with tetrahydro-2*H*-pyran-4-ylmethylamine to provide (7-benzyloxy-3-nitroquinolin-4-yl)(tetrahydro-2*H*-pyran-4-ylmethyl)amine. The same  
5 method can be used to treat 6-benzyloxy-4-chloro-3-nitroquinoline with tetrahydro-2*H*-pyran-4-ylmethylamine to provide (6-benzyloxy-3-nitroquinolin-4-yl)(tetrahydro-2*H*-pyran-4-ylmethyl)amine.

Compounds of the invention were found to induce cytokine biosynthesis when tested using the method described below.

#### CYTOKINE INDUCTION IN HUMAN CELLS

An in vitro human blood cell system is used to assess cytokine induction. Activity is based on the measurement of interferon ( $\alpha$ ) and tumor necrosis factor ( $\alpha$ ) (IFN and TNF, respectively) secreted into culture media as described by Testerman et. al. in "Cytokine Induction by the Immunomodulators Imiquimod and S-27609," *Journal of Leukocyte*  
*Biology*, 58, 365-372 (September, 1995).

10

#### Blood Cell Preparation for Culture

Whole blood from healthy human donors is collected by venipuncture into EDTA vacutainer tubes. Peripheral blood mononuclear cells (PBMC) are separated from whole  
 blood by density gradient centrifugation using HISTOPAQUE-1077. Blood is diluted 1:1  
 with Dulbecco's Phosphate Buffered Saline (DPBS) or Hank's Balanced Salts Solution (HBSS). The PBMC layer is collected and washed twice with DPBS or HBSS and  
 resuspended at  $4 \times 10^6$  cells/mL in RPMI complete. The PBMC suspension is added to 48  
 well flat bottom sterile tissue culture plates (Costar, Cambridge, MA or Becton Dickinson  
 Labware, Lincoln Park, NJ) containing an equal volume of RPMI complete media  
 containing test compound.

20

### Compound Preparation

The compounds are solubilized in dimethyl sulfoxide (DMSO). The DMSO concentration should not exceed a final concentration of 1% for addition to the culture wells. The compounds are generally tested at concentrations ranging from 30-0.014 micromolar ( $\mu\text{M}$ ).

### Incubation

The solution of test compound is added at 60  $\mu\text{M}$  to the first well containing RPMI complete and serial 3 fold dilutions are made in the wells. The PBMC suspension is then added to the wells in an equal volume, bringing the test compound concentrations to the desired range (30-0.014  $\mu\text{M}$ ). The final concentration of PBMC suspension is  $2 \times 10^6$  cells/mL. The plates are covered with sterile plastic lids, mixed gently and then incubated for 18 to 24 hours at 37°C in a 5% carbon dioxide atmosphere.

### Separation

Following incubation the plates are centrifuged for 10 minutes at 1000 rpm (approximately 200 x g) at 4°C. The cell-free culture supernatant is removed with a sterile polypropylene pipet and transferred to sterile polypropylene tubes. Samples are maintained at -30°C to -70°C until analysis. The samples are analyzed for interferon ( $\alpha$ ) by ELISA and for tumor necrosis factor ( $\alpha$ ) by ELISA or IGEN Assay.

### Interferon ( $\alpha$ ) and Tumor Necrosis Factor ( $\alpha$ ) Analysis by ELISA

Interferon ( $\alpha$ ) concentration is determined by ELISA using a Human Multi-Species kit from PBL Biomedical Laboratories, New Brunswick, NJ. Results are expressed in pg/mL.

Tumor necrosis factor ( $\alpha$ ) (TNF) concentration is determined using ELISA kits available from Biosource International, Camarillo, CA. Alternately, the TNF concentration can be determined by ORIGEN M-Series Immunoassay and read on an IGEN M-8 analyzer from IGEN International, Gaithersburg, MD. The immunoassay uses a human TNF capture and detection antibody pair from Biosource International, Camarillo, CA. Results are expressed in pg/mL.

Certain compounds of the invention may inhibit the production of TNF- $\alpha$  when tested using the method described below.

## CYTOKINE INHIBITION IN MOUSE CELLS

The mouse macrophage cell line Raw 264.7 is used to assess the ability of compounds to inhibit tumor necrosis factor- $\alpha$  (TNF- $\alpha$ ) production upon stimulation by lipopolysaccharide (LPS).

### Single Concentration Assay:

#### Blood Cell Preparation for Culture

Raw cells (ATCC) are harvested by gentle scraping and then counted. The cell suspension is brought to  $3 \times 10^5$  cells/mL in RPMI with 10 % fetal bovine serum (FBS). Cell suspension (100  $\mu$ L) is added to 96-well flat bottom sterile tissues culture plates (Becton Dickinson Labware, Lincoln Park, NJ). The final concentration of cells is  $3 \times 10^4$  cells/well. The plates are incubated for 3 hours. Prior to the addition of test compound the medium is replaced with colorless RPMI medium with 3 % FBS.

#### Compound Preparation

The compounds are solubilized in dimethyl sulfoxide (DMSO). The DMSO concentration should not exceed a final concentration of 1% for addition to the culture wells. Compounds are tested at 5 $\mu$ M. LPS (Lipopolysaccharide from *Salmonella typhimurium*, Sigma-Aldrich) is diluted with colorless RPMI to the EC<sub>70</sub> concentration as measured by a dose response assay.

#### Incubation

A solution of test compound (1 $\mu$ l) is added to each well. The plates are mixed on a microtiter plate shaker for 1 minute and then placed in an incubator. Twenty minutes later the solution of LPS (1  $\mu$ L, EC<sub>70</sub> concentration  $\sim$  10 ng/ml) is added and the plates are mixed for 1 minute on a shaker. The plates are incubated for 18 to 24 hours at 37  $^{\circ}$ C in a 5 % carbon dioxide atmosphere.

### TNF- $\alpha$ Analysis

Following the incubation the supernatant is removed with a pipet. TNF- $\alpha$  concentration is determined by ELISA using a mouse TNF-  $\alpha$  kit (from Biosource International, Camarillo, CA). Results are expressed in pg/mL. TNF- $\alpha$  expression upon LPS stimulation alone is considered a 100% response.

### Dose Response Assay:

#### Blood Cell Preparation for Culture

Raw cells (ATCC) are harvested by gentle scraping and then counted. The cell suspension is brought to  $4 \times 10^5$  cells/mL in RPMI with 10 % FBS. Cell suspension (250  $\mu$ L) is added to 48-well flat bottom sterile tissues culture plates (Costar, Cambridge, MA). The final concentration of cells is  $1 \times 10^5$  cells/well. The plates are incubated for 3 hours. Prior to the addition of test compound the medium is replaced with colorless RPMI medium with 3 % FBS.

### Compound Preparation

The compounds are solubilized in dimethyl sulfoxide (DMSO). The DMSO concentration should not exceed a final concentration of 1% for addition to the culture wells. Compounds are tested at 0.03, 0.1, 0.3, 1, 3, 5 and 10  $\mu$ M. LPS (Lipopolysaccharide from *Salmonella typhimurium*, Sigma-Aldrich) is diluted with colorless RPMI to the EC<sub>70</sub> concentration as measured by dose response assay.

### Incubation

A solution of test compound (200  $\mu$ l) is added to each well. The plates are mixed on a microtiter plate shaker for 1 minute and then placed in an incubator. Twenty minutes later the solution of LPS (200  $\mu$ L, EC<sub>70</sub> concentration  $\sim 10$  ng/ml) is added and the plates are mixed for 1 minute on a shaker. The plates are incubated for 18 to 24 hours at 37 °C in a 5 % carbon dioxide atmosphere.

### TNF- $\alpha$ Analysis

Following the incubation the supernatant is removed with a pipet. TNF- $\alpha$  concentration is determined by ELISA using a mouse TNF-  $\alpha$  kit (from Biosource International, Camarillo, CA). Results are expressed in pg/mL. TNF- $\alpha$  expression upon LPS stimulation alone is considered a 100% response.
